The coupling Navier-stokes/Darcy systems
by vorticity-velocity-pressure formulation

Abstract

In this paper We consider the Coupling Navier-Stokes/Darcy equations in a two or three dimensional domain provided with non standard boundary conditions which involve the normal component of the velocity and the tangential components of the vorticity. We establish a coupled variational formulation of this problem with three independent unknowns: the vorticity, the velocity and the pressure. We discuss coupling conditions and we analyze the global coupled model in order to prove its well-posedness and to characterize effective algorithms to compute the solution of its numerical approximation.

Keywords: coupled problem, Darcy’s equation, Navier-Stokes equation, Finite element.

1 Introduction

There is an increasing interest in coupling incompressible flow and porous media flow. Applications of such complex phenomena can be found in geosciences (modeling of the interaction of rivers with ground water) and in health sciences (modeling of blood flow and organs). In this work, we consider a domain which is governed by the stationary Navier Stokes system on one part of the domain and by a second order elliptic equation derived from Darcy’s law in the rest of the domain, and where the solutions in the two domain are coupled by proper interface conditions. Then we study the vorticity-velocity-pressure Formulation. We discuss some new finite element methods.

A weak solution for the coupled problem is analyzed and is approximated by totally discontinuous elements in [12]. In [13] the coupling of the Navier-Stokes equation with nonhomogeneous boundary conditions is analyzed by using an implicit function theorem. For the Vorticity-velocity-pressure formulation of the Stokes problem and the Navier Stokes problem, we refer to [7], [2] and [5]. The formulation of the problem as an interface equation, and the analyze of the associated (nonlinear) Steklov-Poincaré operators is well presented in [4].

An outline of the paper is as follows:
In Section 2, we present the differential model introducing the Navier-Stokes equations for the fluid and Darcy equations for the porous media. The coupling conditions on the interface between the two domain are well explained.

In section 3 we write the variational formulation of the problem and prove existence and uniqueness results.

In section 4 we introduce the finite elements and a fully discrete system using the curl conforming finite elements for the velocity and the standard continuous elements for the pressure.
Section 5 is devoted to numerical experiments which confirm the theoretical results.

Consider a fluid occupying a bounded domain $\Omega \in \mathbb{R}^n$, ($n = 2, 3$), that is subdivided into two disjoint subdomains $\Omega_1$ and $\Omega_2$. Let $\Gamma_{12}$ denote the interface between the sub-domains: $\Gamma_{12} = \partial \Omega_1 \cap \partial \Omega_2$. The fluid motion is modelled by the Navier-Stokes in $\Omega_1$ and the Darcy equations in $\Omega_2$.

![Figure 1: The Presentation of the geometry](image)

We consider the following system of equations:

$$
\begin{aligned}
(P) & -\nu \Delta u + u \cdot \nabla u + \nabla p = f & \text{in } \Omega_1 \\
\mu u + \nabla p & = f & \text{in } \Omega_2 \\
div u & = 0 & \text{in } \Omega_1 \cup \Omega_2 \\
u.n & = 0 & \text{on } \partial \Omega \\
(u |_{\Omega_1} - u |_{\Omega_2}).n & = 0 & \text{in } \Gamma_{12} \\
p |_{\Omega_1} - p |_{\Omega_2} & = 0 & \text{in } \Gamma_{12} \\
curl u |_{\Omega_1} \times n & = 0 & \text{in } \Gamma_{12}
\end{aligned}
$$

where $u$ is the velocity, $p$ the pressure, $f$ the density of body forces and $\mu$ and $\nu$ positive constants.

### 2 The velocity-Vorticity-pressure formulation of the problem

In this section, we consider the Navier-Stokes equations in a two- or three-dimensional domain provided with a standard boundary conditions.

Using the vorticity $w = \text{curl} u$ as new dependent variable, we obtain the first-order velocity-vorticity-pressure formulation of the Navier-Stokes equations in $\Omega_1$.

As usual, $\text{curl} u$ denotes the vorticity, namely the vector function:

$$
(\text{curl} u) : \begin{cases} 
\left( \frac{\partial u_3}{\partial x_2} - \frac{\partial u_2}{\partial x_3}, \frac{\partial u_1}{\partial x_2} - \frac{\partial u_2}{\partial x_1}, \frac{\partial u_2}{\partial x_1} - \frac{\partial u_1}{\partial x_2} \right) & \text{if } n = 3 \\
\left( \frac{\partial u_2}{\partial x_1} - \frac{\partial u_1}{\partial x_2} \right) & \text{if } n = 2 
\end{cases}
$$

We introduce the unit outward normal vector $\mathbf{n}$ to $\Omega$ on $\Gamma$ and we consider the system of Navier Stokes equations. We write a variational formulation of this problem with three independent unknowns: the vorticity, the velocity and the pressure, and prove the existence of a solution for this problem.

The basic idea in [7] consists in introducing a new variable that is the vorticity $w = \text{curl} u$ as a new unknown and to obtain a new formulation of our problem.
Then, it can be noted that non linear term of the convection \((u, \nabla)u\) can be written as:

\[
(u, \nabla)u = \frac{1}{2} \nabla|u|^2 + \text{curl} u \wedge u.
\]

(1)

Also known as \(\text{curl curl} u = -\Delta u + \text{grad div} u\). Thus, we define a pseudo-pressure \(p\) (usually called the dynamical pressure) by the formula \(p = p + \frac{1}{2}|u|^2\).

We consider now the issue of finding effective coupling conditions across the interface \(\Gamma_{12}\) which separates the fluid flow and the porous medium. This is a classical problem which has been investigated from both a physical and a rigorous mathematical point of view.

Adding the new unknown the system of equations \((P)\) is fully equivalent to:

\[
\begin{aligned}
\nu \text{curl} w + w \wedge u + \nabla p &= f_1 \quad \text{in } \Omega_1 \\
\mu u + \nabla p &= f_2 \quad \text{in } \Omega_2 \\
\text{div} u &= 0 \quad \text{in } \Omega_1 \cup \Omega_2 \\
\text{curl} u &= w \quad \text{in } \Omega_1 \\
u\cdot n &= 0 \quad \text{in } \partial\Omega \\
(u|_{\Omega_1} - u|_{\Omega_2}).n &= 0 \quad \text{on } \Gamma_{12} \\
p|_{\Omega_1} - p|_{\Omega_2} &= 0 \quad \text{on } \Gamma_{12} \\
\gamma_t(w) &= 0 \quad \text{on } \Gamma_{12}
\end{aligned}
\]

In the following, \(n_1\) and \(n_2\) denote the unit outward normal vectors to the surfaces \(\partial \Omega_1\) and \(\partial \Omega_2\), respectively, and we have \(n_1 = -n_2\) on \(\partial \Omega\).

We recall that the trace operator: \(v \rightarrow v.n\) is continuous from \(H(\text{div}, \Omega)\) to \(H^{-\frac{1}{2}}(\partial \Omega)\) and the jump \((v|_{\Omega_1} - v|_{\Omega_2}).n\) vanishes on \(\Gamma_{12}\).

To make precise the sense of the operator, \(\gamma_t\) we recall that it is the trace operator and the tangential trace operator on \(\partial \Omega\), defined by \(\gamma_t(w) = w \times n\) in dimension \(n = 2\) and \(n = 3\) respectively.

In all the paper, we suppose that \(f_1\) and \(f_2\) the density of body forces in \(\Omega_1\) and \(\Omega_2\) respectively are in \(L^2(\Omega)^3\). In fact, \(f_1\) has a value in \(\Omega_1\) and vanish in the rest of the domain, and \(f_2\) has a value in \(\Omega_2\) and vanish in the rest of the domain.

In order to write the variational formulation of the previous problem, we introduce the following spaces:

\[
W^{m,p}(\Omega) = \{v \in L^p(\Omega)^3, \partial^\alpha v \in L^p(\Omega)^3, \forall \ |\alpha| \leq m \}
\]

\[
H^m(\Omega) = W^{m,2}(\Omega)
\]

As usual, we shall omit \(p\) when \(p = 2\) and denote by \((.,.)\) the scalar product of \(L^2(\Omega)\). Also, recall the familiar notation:

\[
H^1_0(\Omega) = \{v \in H^1(\Omega); v = 0 \text{ on } \partial \Omega\}
\]

with the Poincaré inequality

\[
\forall v \in H^1_0(\Omega), \|v\|_{0,\Omega} \leq c \|v\|_{0,\Omega}
\]

We consider the domain \(H(\text{div}, \Omega)\) of the divergence operator, namely:

\[
H(\text{div}, \Omega) = \{v \in L^2(\Omega)^3, \text{div} v \in L^2(\Omega)\}
\]

and also its subspace

\[
H_0(\text{div}, \Omega) = \{v \in H(\text{div}, \Omega), v.n = 0 \text{ on } \partial \Omega\}
\]
Where ( , ) denotes the duality pairing between $H_0(div, \Omega)$ and it's dual.

We introduce the operator space $\text{curl}$

$$
H(\text{curl}, \Omega) = \left\{ \vartheta \in (L^2(\Omega))^n; \ curl \vartheta \in L^2(\Omega)^n \right\}.
$$

And the subspace of $H(\text{curl}, \Omega)$

$$
H_0(\text{curl}, \Omega) = \{ \vartheta \in H(\text{curl}, \Omega); \gamma_\ell(\vartheta) = 0 \text{ in } \partial \Omega \}.
$$

**Remark**

- In dimension $n = 2$, the space $H(\text{curl}, \Omega)$ coincides with the space $H^1(\Omega)$ and the space $H_0(\text{curl}, \Omega)$ coincides with the space $H^1_0(\Omega)$.
- In dimension $n = 3$, $H^1(\Omega) \subset H(\text{curl}, \Omega)$ and $H^1_0(\Omega) \subset H(\text{curl}, \Omega)$.

### 3 Variational formulation

Considering $X = \{ v \in (L^2(\Omega))^3, curlv|_{\Omega_1} \in (L^2(\Omega_1))^3 \}$, and then we obtain the following weak variational formulation, denoted by (V):

$$
\begin{align*}
\text{Find } & u \in X \text{ and } p \in H^1(\Omega)/\mathbb{R} \text{ such that:} \\
& (\mu(u),v)_{\Omega_2} + (\text{curl}(u),\text{curl}v)_{\Omega_1} + (u,v)_{\Omega_1} + \int_{\Omega_1} (\nabla q,v) = (f_1 + f_2,v)_{\Omega} \forall v \in X \\
& (\nabla q,u)_{\Omega_1} = 0 \quad q \in H^1(\Omega)/\mathbb{R}
\end{align*}
$$

For simplicity we denote by $f = f_1 + f_2$ such that $f_1$ has a value in $\Omega_1$ and vanish in the rest of the domain, and $f_2$ has a value in $\Omega_2$ and vanish in the rest of the domain, so we have:

$$
\begin{align*}
f = \begin{cases} 
  f_1 & \text{in } \Omega_1 \\
  f_2 & \text{in } \Omega_2
\end{cases}
\end{align*}
$$

We introduce the problem, establish a decoupled variational formulation and prove its wellposedness. Then we consider the following system of equations:

$$
\begin{align*}
\text{Find } & (w, u, p) \in H_0(\text{curl}, \Omega) \times H_0(div, \Omega) \times L^2_0(\Omega) \text{ such that:} \\
& \forall v \in H_0(div, \Omega), \quad a(w, u, v) + h(w, u, v) + b(v, p) = (f , v)_{\Omega} \\
& \forall q \in L^2_0(\Omega), \quad b(u, q) = 0 \\
& \forall \vartheta \in H_0(\text{curl}, \Omega), \quad c(w, u, \vartheta) = 0.
\end{align*}
$$

The bilinear forms are $a(., .), b(., .)$ and $c(., .)$ are defined by :

$$
\begin{align*}
a(w, u, v) = \mu \int_{\Omega_2} u(x) \cdot v(x) dx + \nu \int_{\Omega_1} (\text{curl}w)(x) v(x) dx
\end{align*}
$$

$$
\begin{align*}
b(v, q) = \int_{\Omega} (\text{div}v)(x) q(x) dx
\end{align*}
$$

$$
\begin{align*}
c(w, u, \varphi) = \int_{\Omega} (w)(x) \varphi(x) dx - \int_{\Omega} u(x) \cdot (\text{curl} \varphi)(x) dx
\end{align*}
$$

And the trilinear form $h(., .)$ is defined by:

$$
\begin{align*}
h(w, u, v) = \int_{\Omega} (w(x) \wedge u(x)) v(x) dx
\end{align*}
$$

We need the next properties which are more developed and demonstrated in [1]:
1. The first property is based on the characterisation of the domain, in fact if $\Omega$ is simply-connected there exist a constant $c_0$ such that:

$$\|v\|_{L^2(\Omega)^n} \leq c_0 \|\text{curl}v\|_{L^2(\Omega)}^{\frac{n(n-1)}{2}}$$  \hspace{1cm} (8)$$

2. The positivity and inf-sup condition for the form $a(\cdot,\cdot,\cdot)$:

There exists a positive constant $\alpha$, such that the form $a(\cdot,\cdot,\cdot)$ satisfies

$$\forall v \in V \setminus 0 \quad \sup_{(w,u) \in W} a(w,u,v) > 0$$

$$\forall (w,u) \in W \quad \sup_{v \in V} \|a(w,u,v)\|_{L^2(\Omega)^n} \geq \alpha (\|w\|_{H_0(\text{curl},\Omega)} + \|v\|_{L^2(\Omega)^n})$$

where $W = H_0(\text{curl},\Omega) \times H_0(\text{div},\Omega)$.

In fact:

$$a(w,u,v) = \mu \int_{\Omega_1} u(x) \cdot v(x) \, dx + \nu \int_{\Omega_1} (\text{curl} u)(x) \cdot v(x) \, dx$$

$$= I_{\Omega_1}(w,u,v) + I_{\Omega_1}(w,u,v)$$

Where

$$I_{\Omega_1}(w,u,v) = \nu \int_{\Omega_1} (\text{curl} u)(x) \cdot v(x) \, dx$$

$$= \nu \int_{\Omega_1} (\text{curl} w)(x)(\text{curl} u)(x) + u(x) \, dx.$$

$$= \nu \int_{\Omega_1} (\text{curl} w)(x)^2 \, dx + \nu \int_{\Omega_1} (\text{curl} w)(x)u(x) \, dx$$

$$= \nu \|\text{curl} w\|_{L^2(\Omega)}^2 + \nu \int_{\Omega_1} (\text{curl} w)(x)u(x) \, dx.$$

Which gives:

$$I_{\Omega_1}(w,u,v) = \nu \|\text{curl} w\|_{L^2(\Omega)}^2 + \nu \int_{\Omega_1} (\text{curl} w)(x)u(x) \, dx$$

$$+ \nu \int_{\Omega_1} (\text{curl} w)(x)u(x) \, dx.$$

By using Green’s formula in a domain $\Omega_1$:

$$\int_{\Omega_1} (\text{curl} w)(x)u(x) \, dx = \int_{\Omega_1} (\text{curl} u)(x)w(x) \, dx - \int_{\partial\Omega_1} \gamma_1(w)\tilde{\gamma}(u)(\tau) \, d\tau.$$ 

with the boundary condition on $\partial\Omega_1$.

$$\int_{\partial\Omega_1} \gamma_1(w)\tilde{\gamma}(u)(\tau) \, d\tau = 0 \quad \text{because} \quad w \in H_0(\text{curl},\Omega_1).$$

And with condition $w = \text{curl} u$, we obtain

$$\int_{\Omega_1} (\text{curl} u)(x)w(x) \, dx = \int_{\Omega_1} (\text{curl} u)(x)(\text{curl} u)(x) \, dx$$

$$= \|\text{curl} u\|_{L^2(\Omega)}^2.$$
The form $I_{\Omega_1}$ becomes:

$$I_{\Omega_1}(w, u, v) = \frac{\nu}{2}\|\text{curl } w\|^2_{L^2(\Omega_1)} \frac{n(n-1)}{2} + \frac{\nu}{2}\|w\|^2_{L^2(\Omega_1)} \frac{n(n-1)}{2} + \nu\|\text{curl } w\|_{L^2(\Omega_1)^n}.$$

If $\Omega$ is simply connexe [1], we have using (9):

$\forall u \in V, \quad \|u\|_{L^2(\Omega_1)^n} \leq c_0\|	ext{curl } u\|_{L^2(\Omega_1)^n}.$

For all $u \in V$, we have:

$$I_{\Omega_1}(w, u, v) \geq \frac{\nu}{2}\|w\|^2_{L^2(\Omega_1)} \frac{n(n-1)}{2} + \frac{\nu}{2c_0}\|u\|^2_{L^2(\Omega_1)^n}.$$

and then

$$I_{\Omega_1}(w, u, v) \geq \frac{\nu}{2}\|w\|^2_{L^2(\Omega_1)} \frac{n(n-1)}{2} + \frac{\nu}{2c_0}\|u\|^2_{L^2(\Omega_1)^n}. \quad (9)$$

In another part we have:

$$I_{\Omega_2}(w, u, v) = \mu \int_{\Omega_2} u(x) \cdot v(x) \, dx$$

$$= \mu \int_{\Omega_2} u(x) \cdot ((\text{curl } w)(x) + u(x)) \, dx$$

$$= \mu \int_{\Omega_2} (u)^2(x) \, dx + \mu \int_{\Omega_2} (\text{curl } w)(x) \cdot u(x) \, dx$$

$$= \mu(\|u\|^2_{L^2(\Omega_2)^n} + \|	ext{curl } u\|^2_{L^2(\Omega_2)^n})$$

And then using (9) we obtain the inequality:

$$I_{\Omega_2}(w, u, v) \geq (\mu + \frac{\mu}{c_0})\|u\|^2_{L^2(\Omega_2)^n}. \quad (10)$$

The inequalities (10) and (11) give:

$$a(w, u, v) \geq \frac{\nu}{2}\|w\|^2_{L^2(\Omega_1)} \frac{n(n-1)}{2} + \frac{\nu}{2c_0}\|u\|^2_{L^2(\Omega_1)^n} + (\mu + \frac{\mu}{c_0})\|u\|^2_{L^2(\Omega_2)^n}. \quad (11)$$

In the other part we have:

$$\|v\|^2_{L^2(\Omega)^n} = \|	ext{curl } w + u\|^2_{L^2(\Omega)^n}$$

$$\leq (\|u\|_{L^2(\Omega)^n} + \|	ext{curl } w\|_{L^2(\Omega)^n})^2$$

$$\leq 2(\|u\|^2_{L^2(\Omega)^n} + \|	ext{curl } w\|^2_{L^2(\Omega)^n}).$$

and

$$a(w, u, v) \geq \frac{\nu}{2}\|w\|^2_{H(\text{curl}, \Omega)} + \frac{1}{c_0}\|u\|^2_{L^2(\Omega)^n}. \quad \frac{\nu}{2\sqrt{2}}\|\text{curl } w\|_{L^2(\Omega)^n} + \|w\|_{L^2(\Omega)^n}. \quad (12)$$

If we take the condition $0 < c_0 \leq 1$ we obtain:

$$a(w, u, v) \geq \frac{\nu}{2\sqrt{2}}\|w\|^2_{H(\text{curl}, \Omega)} + \frac{1}{c_0}\|u\|^2_{L^2(\Omega)^n}.$$

and

$$\sup_{v \in V} \frac{a(w, u, v)}{\|v\|_{L^2(\Omega)^n}} \geq \alpha(\|w\|_{H(\text{curl}, \Omega)} + \|u\|_{L^2(\Omega)^n}).$$
3. The inf-sup condition for the form $b(.,.)$: 
There exist a positive constant $\beta$ such that the forme $b(.,.)$ satisfies:

$$\forall q \in L^2_0(\Omega)^n \sup_{v \in H_0(\text{div}, \Omega)} \frac{b(v, q)}{\|v\|_{H(\text{div}, \Omega)}} \geq \beta \|q\|_{L^2(\Omega)}. \quad (12)$$

4. The continuity of the non linear term $h(w, u; v)$ is more presented in [13], [4]. We need some Sobolev imbedding theorem and from the Holder’s inequality we have:

$$h(w, u; v) \leq c \|w\|_{L^p(\Omega)}^{\alpha(n-1)} \|u\|_{H^1(\Omega)^n} \|v\|_{L^q(\Omega)^n}$$

with

- $p = 6$ and $q = 3$ in dimension $n = 2$.
- $p = q = 4$ in dimension $n = 3$.

**Theorem 3.1** For all $f \in H_0(\text{div}, \Omega)$, the problem $(V)$ has an unique solution $(w, u, p) \in H_0(\text{curl}, \Omega) \times H_0(\text{div}, \Omega) \times L^2_0(\Omega)$, this solution satisfy the next inequality:

$$\|w\|_{H(\text{curl}, \Omega)} + \|u\|_{H(\text{div}, \Omega)} + \|p\|_{L^2(\Omega)} \leq c_0 \|f\|_{H_0(\text{div}, \Omega)}. \quad (14)$$

**Theorem 3.2** Problem $(Q)$ and $(P)$ are equivalent in the sence that any $(w, u, p) \in H(\text{curl}, \Omega) \times H(\text{div}, \Omega) \times L^2_0(\Omega)$ such that $(w \land u)$ belongs to $L^2(\Omega)$ is a solution of problem $(Q)$ if and only if it is a solution of $(P)$.

### 4 Finite element discretization

In what follows and for simplicity, we make the further assumption that both $\Omega$ and $\Omega_F$ are polyhedra. We introduce a regular family of triangulation $(\tau_h)_h$ in the sense that:

- for each $h$, $\bar{\Omega}$ is the union of all elements of $\tau_h$;
- for each $h$, the intersection of two different elements of $\tau_h$, if not empty, is a corner, a whole edge or a whole face of both of them;
- the ratio of the diameter $h_k$ of an element $k$ in $\tau_h$ to the diameter of its inscribed sphere is bounded by a constant independent of $k$ and $h$ (As usual, $h$ denotes the maximum of the diameters of the elements of $\tau_h$);
- $h$ denotes the maximum of the diameters of the elements of $\tau_h$. We denote by $\tau_h^{-1}$ $(resp \tau_h^{<2})$ the set of elements $k$ of $\tau_h$ which are contained in $\Omega_1$ $(resp \Omega_2)$.

We introduce the spaces:

- $\mathbf{P}_0(k)$ space of the restrictions to $k$ of constant functions on $\mathbb{R}^3$
- $\mathbf{P}_1(k)$ space of the restrictions to $k$ of affine functions on $\mathbb{R}$ and the space $\mathbf{P}_K(k)$ of the restrictions to $k$ of polynomials $v$ of the form:

$$v(x) = a + b \land x, \ a \in \mathbb{R}^3, b \in \mathbb{R}^3$$

The space $\mathbf{P}_K(k)$ and the corresponding finite elements are studied in [9]. Their degrees of freedom are the average flux along the edges $\int_l (v, t) dl$ for the six edges $l$ of $k$, $t$ is the direction vector of $l$. Hence, we associate the operator $r_k$ where $r_k(u)$ is the unique polynomial of $\mathbf{P}_K$ that has the same flux along the edges as $u$. We define also the operator $I_k$ where $I_k(q)$ is the unique polynomial of $\mathbf{P}_1$ that has the same values on the vertex of $k$ as $q$.

We have for all $k \in \tau_h$:

$$r_k(\nabla q) = \nabla I_k(q), \ \forall q \in W^{2,t}(k), \ \forall t > 2. \quad (15)$$

Next, let us introduce the discrete spaces:

$$X_h = \{ u_h \in X; u_{h|k} \in \mathbf{P}_K(k), \forall k \in \tau_h \}, \quad (16)$$
\( Q_h = \{ q_h \in C^0(\bar{\Omega}); q_h|_{k} \in P_1(k), \forall k \in \tau_h \} \),

With these spaces, the finite dimensional analogues of \( U \) is:

\( U_h = \{ v_h \in X_h; (\nabla q_h, v_h) = 0, \forall q_h \in Q_h \} \).

We define the interpolation operators:

\[
    r_h : H^1(\Omega) \rightarrow X_h \\
    u \mapsto r_h(u)
\]

\[
    I_h : H^2(\Omega) \rightarrow Q_h \\
    u \mapsto I_h(u)
\]

We discretize \((V)\) by:

Find \( u_h \in X_h \) and \( p_h \in Q_h/R \) such that

\[
\mu(u_h, v_h)_{\Omega_2} + \nu(\text{curl} u_h, \text{curl} v_h)_{\Omega_1} + (\text{curl} u_h \wedge v_h)_{\Omega_1} + (\nabla p_h, v_h)_{\Omega} = (f, v_h)_{\Omega}, \quad \forall v_h \in X_h.
\]

**Theorem 4.1** Assume that \( \tau_h \) is regular family of triangulations. We have:

\[
\| u - r_h(u) \|_{0,\Omega} + h \| \text{curl}(u - r_h(u)) \|_{0,\Omega} \leq C h |u|_{1,\Omega},
\]

\( \forall u \in W^{1,\epsilon}(\Omega)^3, \quad \forall t > 2. \)

More over, we have, when \( u \in H^2(\Omega)^3 \):

\[
\| u - r_h(u) \|_{0,\Omega} \leq C h^2 |u|_{2,\Omega},
\]

\[
\| \text{curl}(u - r_h(u)) \|_{0,\Omega} \leq C h |u|_{2,\Omega},
\]

\[
\| \text{curl}(u - r_h(u)) \wedge (u - r_h(u)) \|_{0,\Omega} \leq C^2 h^3 |u|_{2,\Omega}.
\]

**Theorem 4.2** Let \( \Omega \) be a polyhedron and \( \Omega_1 \) a convex polyhedron. Let \( \tau_h \) be a uniformly regular family of triangulation of \( \Omega \). We have:

\[
\| u_h \|_{0,\Omega_1} \leq c_0 (\| u_h \|_{0,\Omega_2}^2 + \| \text{curl} u_h \|_{0,\Omega_1}^2 + \| \text{curl} u_h \|_{0,\Omega_1}^2)^{\frac{1}{2}}, \quad u_h \in U_h.
\]

For the proof of this theorem we need the following results, [10]:

**Theorem 4.3** \( \forall v \in L^2(\Omega_1)^3 \), satisfying:

\( \text{div} v = 0 \), \( \text{curl} v \in L^2(\Omega_1)^3 \), \( v \cdot n = 0 \) on \( \Gamma \),

verify

\[
\| v \|_{0,\Omega_1} \leq c \| \text{curl} v \|_{0,\Omega_1}.
\]

If \( \Omega_1 \) is convex, \( v \in H^1(\Omega_1) \) and we have

\[
\| v \|_{1,\Omega_1} \leq c \| \text{curl} v \|_{1,\Omega_1}.
\]

**Proof**

Let \( \Omega_1 \) be convex, for every \( u_h \in X_h \) we consider the Dirichlet problem:

\( (\nabla z, \nabla \mu)_{\Omega_1} = (u_h, \nabla \mu)_{\Omega_1}, \quad \forall \mu \in H^1(\Omega_1)/R \).

We denote

\( \omega = u_h - \nabla z_h \in U_{\Omega_1} = \{ v \in H(\text{curl}, \Omega_1); (v, \nabla q)_{\Omega_1} = 0, \forall q \in H^1(\Omega_1)/R \}, \)
we have
\[ \text{curl } \omega = \text{curl } u_h. \]

From theorem 3, it follows that
\[ \| \omega \|_{1, \Omega_1} \leq c_1 \| \text{curl } \omega \|_{0, \Omega_1}, \]
and we refer to [9] and [10] for more detail about the next inequality:
\[ \| r_h \omega - \omega \|_{0, \Omega_1} \leq c_2 \| \text{curl } u_h \|_{0, \Omega_1}. \]

Then, we apply the operator \( r_h \) to \( \omega, u_h \) is written:
\[ u_h = r_h \omega + \nabla z_h, \quad z_h \in Q_h. \]

Hence
\[ \| u_h \|_{0, \Omega_1} \leq \| r_h \omega - \omega \|_{0, \Omega_1} + \| \omega \|_{0, \Omega_1} + 2 \| \text{curl } u_h \wedge u_h \|_{0, \Omega_1}, \]

Firstly, we have
\[ \| r_h \omega - \omega \|_{0, \Omega_1} \leq c_2 \| \text{curl } u_h \|_{0, \Omega_1}, \]
\[ \| \omega \|_{0, \Omega_1} \leq \| \omega \|_{1, \Omega_1} \leq c_1 \| \text{curl } u_h \|_{0, \Omega_1}, \]
\[ \| \text{curl } u_h \wedge u_h \|_{0, \Omega_1} \leq \| \text{curl } u_h \|_{0, \Omega_1} \| u_h \|_{0, \Omega_1} \leq c_3 \| \text{curl } u_h \|_{2, \Omega_1}^2. \]

It remains to be seen \( \| \nabla z_h \|_{0, \Omega_1} \). For this we take \( \mu_h \in Q_h \):
\[
(\nabla z_h, \nabla \mu_h)_{\Omega_1} = (u_h - r_h \omega, \nabla \mu_h)_{\Omega_1} \\
= (u_h, \nabla \mu_h)_{\Omega_1} + (\omega - r_h \omega, \nabla \mu_h)_{\Omega_1} \\
= - (u_h, \nabla \mu_h)_{\Omega_2} + (\omega - r_h \omega, \nabla \mu_h)_{\Omega_1} \\
\leq \| u_h \|_{0, \Omega_2} \| \nabla \mu_h \|_{0, \Omega_2} + c_2 \| \text{curl } u_h \|_{0, \Omega_1} \| \nabla \mu_h \|_{0, \Omega_1}. 
\]

We choose \( \mu_h \in Q_h \) such that:
\[ \mu_h \setminus \Omega_1 = z_h \setminus \Omega_1, \quad \mu_h \setminus \partial \Omega = 0, \]
so we obtain:
\[ \| \nabla \mu_h \|_{0, \Omega_2} \leq c \| z_h \|_{\frac{1}{2}, \Gamma} \leq c_4 \| \nabla z_h \|_{0, \Omega_1}. \]

We deduce that:
\[ \| \nabla z_h \|_{0, \Omega_1} \leq c \| u_h \|_{0, \Omega_2} + c \| \text{curl } u_h \|_{0, \Omega_1}. \]

And finally the result.

5 Numerical results

To validate the theoretical results, we performed several numerical simulations using the FreeFem ++ software (see [14]).

The geometry considered is a square \([0, 1.5] \times [-1, 0]\). The numerical force and the pressure are taken as
\[ f(x, y) = x^2 + y^2, \]
\[ p(x, y) = -x - y. \]

We take \( \mu \) and \( \nu \) equal to 1 for simplicity. In what follows, we present the results obtained. The geometry mesh is given by figure 2.

In figure 3, we can see the isovalues for the velocity.
