Abstract

Aims: Assess nurses' knowledge & practice about infection control regarding kidney transplantation patients, design and implement of nursing teaching protocol regarding kidney transplantation patients, & assess the effect of nursing teaching protocol on nurses' knowledge and practice about infection control regarding kidney transplantation patients. The study was conducted in the kidney transplantation unit of Assiut Nephrology Hospital; data were collected from all nurses working in Kidney Transplantation Unit (30 nurses). Three tools used for data collection; Pre-posttest interview questionnaire sheet & observation checklist sheet. & Nursing teaching protocol.

Results: all the nurses were female, most of them their ages were from 18 - 25 years, single, living in the rural area, had a high degree in nursing. Most of them had previous infection-control training. An improvement in the mean knowledge & practice scores were found after the application of the teaching protocol (1st hypothesis). A positive correlation between nurse's knowledge and practice scores after application of the nursing teaching protocol (2nd hypothesis).

Conclusions: Improving nurse's knowledge and practice can favorable affect the incidence and outcome of kidney transplantation patients.

Recommendations: There is a need for continued and written standards training programs about infection control regarding kidney transplantation patients and should be available.

Keywords: Infection Control; Kidney Transplantation; & Nursing Teaching Protocol.

1. Introduction

Kidney transplantation was the ideal treatment option for many patients with ESRD because of: a better quality of life, a greater freedom from dependence upon a machine, freedom from fluid and dietary restriction, return of sexual function and fertility with the possibility of parenthood. It had been estimated that the cost of continuing to care for the transplanted patient was one-fifth of the cost of dialysis per year (Saad et al., 2011). Kidney transplant operations should be attempted only after a period of study and preparation. Therefore, careful pre-transplant evaluation and teaching were necessary to prepare the patient for surgery and postoperative course, and also to provide a greater chance of long-term success. The patient undergoing kidney transplantation requires aggressive medical care and expert nurses for educating the patient and family, meeting care needs, and for close monitoring and management. (El-Gharabawy et al., 2011).

Medical-Surgical Nursing practice requires complex combinations of knowledge, performance, skills and attitudes, a holistic definition of competence. This could facilitate greater acceptance of the concept and development of competency standards. The Standards of Care gives an overview of how the nurse will collect and analyze the data, identify the problems, and plan of care. Implementation of the plan, coordination of the care using all resources available, and reinforcing with teaching and health promotion covers the general nephrology nurse standards. (Ibrahim et al., 2014).

Knowledge of the nurse of post-operative care of kidney transplantation was of crucial importance and had an impact on nurse's practice. The main goal of care was to maintain homeostasis until the transplanted kidney functioning well. Furthermore, there were several complications related to transplanting such as rejection, infection and those related to immunosuppressive. So, the success of the kidney transplant depends on the maintenance of functioning graft (Nakashima et al., 2012).

The nurses who will gain more information about infection control that may decrease post-operative infection for kidney transplantation patients. Therefore, strengthening and integrating universal precaution with the routine services through the provision of training and preparing and introducing health-care workers infection prevention standard of practice, protocol, rules, regulation and opportunities to promote the desired team spirit at all health facility levels were recommended. (Hussen and Shichata, 2016).

1.1. Significance of the study

Kidney transplantation is considered the main decision strategy for renal replacement therapy for end-stage renal disease patients who had no physical or psychological contraindications; healthcare-associated infection (HAI) prevalence survey found that there were an estimated 157,500 surgical site infections associated with...
inpatient surgeries in 2013. Applying universal precautions are very important for decreasing the risk of infection (CDC, 2017 & van, 2014). According to experience of researchers, it was noted that the nurse's knowledge about that measures insufficient and requirement for improvement.

1.2. Aims of the study

1) Assess nurses' knowledge & practice about infection control regarding kidney transplantation patients
2) Design and implement of nursing teaching protocol regarding kidney transplantation patients
3) Assess the effect of nursing teaching protocol on nurses knowledge and practice about infection control regarding kidney transplantation patients

1.3. Hypotheses

To fulfill the aim of the study, the following research hypotheses will be formulated:
1) The post mean knowledge and practice scores of nurses who will be exposed to a designed nursing teaching protocol will be higher than their pre mean scores.
2) A positive relationship will exist between knowledge and practice scores obtained by nurses receiving the designed nursing teaching protocol.

2. Patients and method

2.1. Research design

Quasi experimental (pre and posttest) research design was utilized throughout this study.

2.2. Setting

The study was conducted at kidney transplant unit of Nephrology University Hospital

2.3. Subjects

All nurses working at kidney transplant unit (30 nurses).

2.4. Tools

Data pertinent to the study were collected, using the following 3 tools:

2.4.1. Pre and posttest interview questionnaire sheet

This tool was to measure the exact knowledge level of nurses about infection control regarding kidney transplant. The researchers used it pre & post the intervention of the teaching protocol. It consisted of two parts: The total number of items (32).

A- Demographic data included 9 items about the nurses' code, age, gender etc…
B Nurse's knowledge included 9 items about kidney transplantation definition, causes, emergency care, & 14 items about universal precautions nursing care to post kidney transplant patients. The questionnaire sheet was filled by the researchers after asking the nurses.

Scoring system:
Correct answer = 2 & incorrect answer = 1. The total scores were 64. < 50 % unsatisfactory level of knowledge, 50 %: 70% satisfactory level of knowledge, & > 70 % good level of knowledge.

2.4.2. Observation checklist sheet

It was applied by the researchers to assess the nurse's practice as regard prevention of infection with post kidney transplant patients.

It used before and immediately after the application of the teaching protocol. It consisted of:
1) General precautions for the care of kidney transplant patients who included 7 items.
2) Specific precautions. (Items from 8 to 14), as regards activities to minimize infection during the following procedures: cannula insertion, IV fluid infusion, blood transfusion, urinary catheter insertion, suctioning, nasogastric tube insertion (Ryle), surgical wound care.
3) Infection-control measures. It includes 11 items (Items from 15 to 25) which includes universal precautions as: hand washing, wear gloves, change gloves, remove gloves promptly, wear gown, mask & eye protection, patient-care equipment, dealing with sharp objects, & blood, body secretions & fluids, maintain clean environment, safe injection practices, visitors precaution, patient dietary, & precautions.

Scoring system:
(2) For correct & complete step, (1) for correct & incomplete step, & (0) for incorrect step.
The total score for all items = 206, less than 50% were considered an unsatisfactory level of practice. From (50% to 70%) were considered a satisfactory level of practice. Above than (70%) were considered the good practice level.

2.4.3. Nursing teaching protocol

The nursing teaching protocol was developed based in simple Arabic language by the researcher based on nurse's needs assessment, literature review, opinion of nursing and medical expertise, and researcher experience to evaluate the effect of nursing teaching protocol on nurses' knowledge and practice regarding kidney transplantation patients and consists of three parts:
Part 1: information about kidney transplant (definition, indications, contraindication, & complications)
Part 2: information about infection control for a patient with kidney transplantation (definition of infection, chain of infection, & precaution to decrease infection).
Part 3: information about how to perform hand washing, gloves (wear, change, & remove), wear gown, mask & eye protection, care of equipment, dealing with sharp objects, blood, body secretions & fluids, maintain clean environment, safe injection practices, visitors precaution, patient dietary, & precautions.
Part 4: information about how to perform cannula insertion, IV fluid infusion, blood transfusion, urinary catheter insertion, suctioning, nasogastric tube insertion (Ryle), surgical wound care.

3. Methods of data collection

3.1. Administrative approval

Official permission was obtained from the head of the kidney transplant unit of Nephrology University Hospital to conduct the study, the aim of the study was explained to them to obtain their cooperation.

3.2. Pilot study

Three nurses (10%) to examine the feasibility and clarity of the study tools who included in the actual study. Analyses of the pilot study revealed that minimal modifications were required, these modifications were done.

3.3. Ethical consideration

The study will be approved by the Faculty ethics committee; an oral approval was obtained from the enrolled patients to participate in the study after explaining the nature and purpose of the study. The researchers explained that participation is voluntary, and their participation status will not affect the care they will receive.
3.5. Data collection

The data were collected over a period of 6 months starting from January 2017 till the end of June 2017. The data collection was done in the following phases:

3.5.1. The preparatory phase

The researchers designed the protocol and assessed nurse's knowledge and practice (using tool I and II) and content feasibility and reliability tools was assessed by three experts in nursing and nephrology field. Researchers prepared the training places, teaching aids and media (pictures, videotapes, Power Point presentation and handouts).

3.5.2. The implementation phase

Nursing teaching protocol sessions:
The researchers filled out the pre - test interview questioner sheet. The teaching protocol was implemented during their shift hours. Three sessions were varied according to nurse's understanding and availability. There were a total three sessions were conducted for nurses, each session ranged between (20 - 30) minutes except for the session for discharge instruction, which took 60 minutes. Each session usually started by a summary of what was taught during the previous session and the objectives of the new session. After each session, there was 5 minutes for discussion and gave feedback. Reinforcement of teaching was performed according to the nurse's ability to ensure their understanding. Each nurse obtains a copy of the nursing teaching protocol booklet. The researcher used pictures for illustration, diagram, and video to educate the nurse.

The first session it contains two parts:
Part 1: Information about the kidney transplant (definition, indications, contraindication, & complications)
Part 2: Information about the information about infection control for patient with kidney transplantation (definition of infection, chain of infection, & precaution to decrease infection.

The second session: Teach nurses how to perform hand washing, gloves (wear, change, & remove), wear gown, mask & eye protection, care of equipment, dealing with sharp objects, blood, body secretions & fluids, maintain clean environment, safe injection practices, visitor's precaution, patient dietary, & precautions.

The third session: Teach nurses how to perform cannula insertion, IV fluid infusion, blood transfusion, urinary catheter insertion, suctioning, naso gastric tube insertion (Ryle), surgical wound care.

3.5.3. The evaluation phase

The last phase nursing teaching protocol is the evaluation phase. In which the nurses was evaluated immediately after implementation of teaching protocol by the researcher. In this phase the nurse's knowledge and practices were evaluated after protocol implementation (tool I and II).

4. Results

Table 1 Showed that all of the nurses (100%) were female, most of them (76.7% ) their age were from 18 - 25 years, (80%) single, (60%) living in rural area, (100%) had high degree in nursing, (86.7%) their experiences from 1-3 years, most of them (80%) had previous infection control training.

Table 2 and Fig. 1. Illustrates that a highly statistical significance difference was between pre & post knowledge, which was very low before the teaching protocol (93.3 unsatisfactory). Furthermore, the mean nurses' knowledge scores increased after the application of the teaching protocol (93.3 Satisfactory).

Table 3 and Fig. 2. Showed that the nurses' practice scores improved after the application of the teaching protocol.

Fig. 3. Showed a positive correlation between nurse's knowledge and practice scores.

Table 4. Show that there was highly statistical significance between pre & post- nurses' practice. A sharp improvement in the practice scores in post - test (90.0%, 90.0%, and 86.7% respective- ly). Results showed that demographic characteristics not affect nurse's pre- knowledge.

5. Discussion

The results revealed that all of the nurses were female and had a high degree in nursing, and their experiences from 1 to 3 years, most of their ages were from 18 to 25 years, single, living in the rural area, take previous training about infection control.

Most of them had no in-serves training courses related to infection control so their knowledge regarding infection control before implementation of teaching protocol was inadequate.

This result disagreed with that of (Navid et al., 2011 & Santina et al, 2015) who reported that a lot of studies revealed that changes in nursing practice occur following the participation of persistent nursing educational programs increase knowledge and skills and can likewise change attitudes. According to (Yatin et al., 2014 & Janet, 2016), bolstered that in service program beneficially affected enhancing the nurses’ performance. These researchers prescribed that educational programs should be organized according to the need of the nurses with constant evaluation.

This study revealed that no relationship between nurse’s sex, years of experience and residence with their knowledge and practice scores, pre and posttest of implementation of the nursing teaching protocol. This result was concurred with (Ahmed et al., 2015 & Ahmed, 2015) who reported that, was no statistically significant relationship between nurse’s knowledge and practice with the sex and residence of the nurses.

This result disagreed with that of (Navid et al., 2011, Meretoja et al. 2015 & Elewa and Elkattan, 2017) who mention that nurses’s knowledge affected by their years of experience observed pretest, posttest furthermore, the subsequent tests. Furthermore, (Helmy et al., 2017, Santana et al. 2015 and Thompson & Barratt, 2017) expressed that, older nurses in one clinical specialty may require a direct measure of guidelines to secure through a training program. At long last, the researchers condensed that, the nursing teaching protocol for nurses working with kidney transplantation patients achieved its objectives. (Sayed et al., 2011, Singh et al., 2011, Dezfooli et al., 2012, Ghanem and El-khayat, 2012, Khalil et al., 2015, Ahmed 2015, Emerson et al. and 2016, Hussein and Shehata, 2016) specified that nurse who had an extensive role in prevention/or reduction of infection.

6. Conclusion

Kidney transplantation patients were at high risk for infection also nurses who were dealing with those patients. Nurse’s information and skills about control measures against infection in kidney
transplant unit at Assiut Nephrology Hospital were insufficient. Nurses were potentially ready to upgrade their knowledge and practice after receiving nursing teaching protocol in addition to have great effect in the patients' outcome.

7. Recommendations

- There is a need for continued education and training programs about require safety measures to diminish infection regarding kidney transplantation patients.
- Written standards for infection control should be available in all departments.
