Abstract

Public ICT Strategic Plan or knowingly known as “Pelan Strategik ICT Sektor Awam (PSICTSA) 2016-2020 has been created to uphold the successful implementation of National Transformation Programme with regards of increasing system delivery among public agency as well as produce high-impact services and conducive ambience, eventually resulting to effective and efficient ICT delivery system. In short, the government has put a huge effort to ensure this ICT Strategic Plan will aid public sector to keeping up with sophisticated system at the same time improve the reputation of public delivery system within the government agency. Hence, government has highlight several guidelines for the implementation of PICTSA, a set of elements that uphold the Government mission in striving Vision 2020 in line with the full leverage of information technology. As a result, well-developed and comprehensive strategic plan within public sector reflect high generate business total income and consistent revenue through ICT exploitation. Eventually, all these conveniences will assist the public sector’s staffs to work in high resourceful manner at the same time brings thousands of benefits towards them in performing the daily tasks. Therefore, the purpose of this paper is to highlights the strategy of transforming the ICT division to Information Management Division within Public sector either ministry level or government agencies in Malaysia. An oral interview session has been conducted in one of the government agencies to collect and gather supportive information. The study shows that Public ICT strategic plan is essential component which reflects a clear visions for organization’s future and established a set of goals advocate to improve organization as well achieve a quality shared vision. Ideally, the result drives the organizational to become a high-competitive company and improving the performance of overall personnel.

Keywords: Information Management Division, Strategic Information Management, Strategic Information Technology Plan, Government Modernization, e-government

1. Introduction

Information Technology (IT) has evolved from a support function to a critical resource for competitive strategy for number of firms. Historically information technology plays the vital role as supporting mechanism and not a strategic resource. In other words, IT or ICT can be a central hub for communication, inventory management, data management, management of information systems as well customer relationship management. In this information age, with rapid growth of ICT advancements, innovation and the business opportunities it creates tend to be technology based. In 2017, Malaysians celebrate 60 years as an independent nation. From the humble and uncertain beginnings, Malaysia have grown and evolved significantly into a modern economy and society.

Beginning with the era of the New Economic Policy (1971-1990), Malaysia stepped into the 2020 era (1991-2020), Vision 2020 is the ultimate goal of Malaysia to Transformation Agenda. Now, Malaysia have to be ready to face the next 30 years. The world in 2050 will be much different from the world today. Next vision of Malaysia is Transformasi Nasional (National Transformation) 2050’ or TN50 which is an initiative to plan for the future of Malaysia in the period 2020 to 2050. From the vision of becoming a developed nation, Malaysia should strive to be amongst the top countries in the world in economic development, citizen well-being and innovation. The development of 1Malaysia obviously can be seen through the implementation Gagasan 1Malaysia: Rakyat Didahulukan Pencapaian Diutamakan (People First, Performance Now), Program Transformasi Ekonomi (Economic Transformation Program) as well as Model Baru Ekonomi (New Economic Model). This consistent effort from the government to grow Malaysia in line with the Eleventh Malaysia Plan, 2016-2020 (RMKe-11) with the theme of Pertumbuhan Berpaksikan Rakyat (Anchoring growth on people), which includes the new dimension to drive the path of well strategic management among the nation.

One of the key elements of RMKe-11 focus on the enhancement given to increase the productivity and efficiency in delivery system according to user’s need and want. The significance of Information, Communication and Technology (ICT) targeting upon the economics growth achievement throughout the effective knowledge management as well as proper approach towards creativity and innovation.
2. Method

This study primarily focuses on searching information related to the fact of public ICT strategy plan by conducting through inter-
view. This method obviously provide the details of the overall process includes the before and after the existence of strategic plan and allow a richer appreciation of the process by which Public ICT strategic plan emerges and develop in public sector.

3. Discussion

Indeed, Information technology firm has become a part of vital and integral part of every business plan [1]. Hence, every organization have to drive their management as well as subordinates to be technology literates in order to be equal with the market technology potential at the same time with market changes that include user needs, new patterns of technology, emerging problems at the same time providing solution as well as with other possible opportunity [2].

![Fig. 1. Information Strategy Levels and Relationship](image)

Figure 1 highlights three important areas that need to put extra concern in each organization with regards to Information System Strategy, Information Technology Strategy and Information Management Strategy [3]. In short, these three linkages must be worked together to achieve the desire goals. Information Management can connect to management, which is organization-based, relationship oriented and management focused. This area is most significance in organization as it acts as main driver in moving both systems and technology that include information policy, vision, relationship between IM, IS and ICT.

While for Information Systems are the division of unit based, demand oriented and business focused. On top of that, it is also can be a set of computer-based and organization-based procedures which transforming data into information. Apart from that, information systems allow the human to come out with a decision, as there will provide desired data or information accordingly through a process called system and process. Normally, this Information System will be implement in most of the department like Human Resources, Finance, Procurement and etc. In short, information system plays the crucial role in organization due to application and systems setup. Finally, Information Technology (IT) or Information and Communication Technology (ICT) focusing on activity-based, supply-oriented and technology focused. Throughout this area, it has various components for instance computers, microprocessors, telecommunications as well as office automation.

Hence, IT or ICT can be as method, techniques and tools used to uphold the process of accessing, storage, retrieval, use and sharing information. In conclusion, IT or ICT can represent as both hardware and software.

Restructuring ICT Division to Information Management Division

The strategy on restructuring ICT Division to Information Management Division in government agency gives the multi-perspectives and views of change. This change is referring to the transformation of technology to information and knowledge age. The change is brought about by many factors which are people, structure and politics. Many efforts have been made aiming to encourage the government agencies to boost the economic growth in Malaysia. However, in managing ICT is not going to be made easier with all the changes taking place, either because of technology or non-technology factors. A strategic plan for new agenda and activities should be done for an organization in government agency to change in long term duration. With this change, managing ICT will succeed if leaders are able to manage the change in technology, processes, management, skills and roles of people’s. Other than that, leaders are also needed to deal effectively with solving crisis or problems due to ICT. On top of that, they have to ensure the strategic plan should be implement and adapting in order to maintain stability and improvement internally. The restructuring organization is a concept that means organizational re-design, people transformation, as well as process orientation. With respect to all the above, there are several issues arise on implementing strategic plan yet still able to cater successful implementation in government agencies.

MAMPU (Malaysian Administrative Modernization and Management Planning Unit) Strategic Plan 2016–2020, has highlighted several guidelines where MAMPU will be the main driver of sophisticated administration and management for public services. Secondly is being a planner as well as an expert of ICT and information management areas in each organization during the initial phase. MAMPU ought to expand more research and development of delivering best and succeed ICT and information management services. In short, MAMPU is one the gigantic organizations that need to play their role in making sure the National Transformation succeed in line with Vision 2020. Based on Ministry of Communication and Multimedia Malaysia, Information Management Division acts as a strategic leader in the implementation of ICT programs for the ministry and its departments or agencies. The functions of the ICT departments are being discussed as follows:

1. To develop, coordinate and monitor implementation of the ICT strategic plan and assess the impact of ICT programs in the ministry and its departments or agencies.
2. To ensure the planning and implementation of ICT programs of the ministry and its departments/agencies are in accordance with the direction of ICT development in the public sector.
3. To strengthen ICT policies and organizational structure to achieve effectiveness and efficiency of ICT services; and others [4].

Table 1 and Table 2 below is the list of Malaysian ministries and government agencies that undergone transformation of ICT Division to Information Management Division. Out of 26 Ministries, 13 ministries have already undergone the transformation process.

Out of 152 government agencies, 15 have already undergone the transformation. It is understood that the best prescription to restructure its entirety involvement within the government agencies.

According to Malcom (1989) as cited in Raja Malik Mohamed. [5] there are several key characteristics of successful strategy approaches to information management which is:

- Thinking towards change;
- In the first thing, a lot of view is required as to why change is required, how change is to be managed and what stages of change implementation are essentials. It is believed that this thing has to be translated into a Restructure Blueprint before being further translated into planned action. However, it should be remembered that without creates the plan, the higher failure risk and potential inability to succeed. Basically, these have to be the role of the leaders and top echelons in the organization.
- Strong leadership;
- As a basic rule, changes will start with the leadership and followed by acceptance by the organizational citizen. In this order, the top management must play the role of transformational leaders with providing necessary policy and standard, organization structure, ensuring that ICT personnel have sufficient authority, influence and resource, and all personnel are given enough enticing and motivation.
- Smart partnership;
- Organizational citizens must be educated in preparing for restructuring. Even more important, they should be made to expect that restructuring can happen anytime and continuously, and become a part of organizational survival. Personnel have to learn to expect that anything can happen, especially due to this strategy for restructuring of ICT division to information management division.
- Training and readiness for the unexpected.

Organization management also needs to address organizational issues like manpower and culture. At this point, organization needs to provide quality education and training to ensure sufficient and appropriate training to all players. Hence, several modules have been published in order to support this transformation for instance; Web Development with Joomla Siri 1/2017, Kursus Metodologi Pembangunan Pelan Strategik ICT (ISP) Siri 1/2017, and many more that been prepared by INTAN (National Institute of Public Administration) which is the public training center under the Public Service Department [2].

**Roles of ICT and Information Player**

The world is changing rapidly which it has been increasing by loops and bounds before long time and most of the organization consist of employee that can handle obstacles in their near future. Behind this growth, there is one department who plays the vital role called as’ Information Technology (IT) or Information Communication Technology (ICT)’, where most of the organization usually rely on in order to ensure the smooth sailing of their business and operation. The front liner of IT and ICT depends on Chief Information Officer (CIO), the head of information technology within an organization who has been charged with broaden of roles with different responsibilities in regards of operation and development of IT. Lawry, Waddell and Singh [6], highlighted that CIO (Chief Information Officer) roles and responsibilities in the public sector are fast evolving due to important role of ICT for government processes and electronic services [5]. The new and fast emerging CKO (Chief Knowledge Officer) is responsible for knowledge generation for example knowledge management activities such as knowledge creation, capture, access and application. CKO is involved in helping everyone in the organization to work smarter. In facilitating knowledge sharing among workers, he/she ensures the development of knowledge-based products and services through a knowledge platform. Today’s platforms are in the form of computing facilities and technologies such as the Internet, Intranet and others. While Chief Digital Officer (CDO) is responsible not only focusing on the development of corporate digital strategies, ensuring the organization to keep up to date with the changes in technology and consumers’ demands, hence the overall responsibility for corporate digital footprint. Their ultimate mission rely on to comprehend and stay in touch with customers and to take part in crafting the experience with those customers receive [7].

**Managing Future and Emerging Technologies**

Generally, government agency will often come to face various descriptions on the change in business, governance and economy that introduced by technology. Emerging and future technologies are technologies that are new, state-of-art and often disruptive, that re-shapes civilization, environment, institution and individual. Assesses technology path into three which namely transformation, extension and niche technologies’. The author views on transformation technology as the reference material for the evolution of the culture such as computer, for the extension technology as providing new scope and applications for example networks and cellular communication, and niche technology as special applications for example software programs or packages. Technology trends is a migrating from operational (technical-based) to tactical (system-based) to strategic (management-based). Johnson [8] has adequately summarized the new roles of ICT. He states that the way users exploit and benefit from technology surge has altered. He stressed that:

- Technology will be for everyone where it change the way of work and become sophisticated.
- Abilities of technologies increase in multiplying effect.
- Technology change governance and create businesses.
- Technology drives management processes and practices [6]

In discussing on future technologies, there are issues and challenges on managing ICT that cannot be escaped. It is paramount significance for top management in government agency such as CIO be conversant with technology because of the high cost incurred due to the need for infinitely networked equipment, as well as specialized skills and expertise. A technology surge is so rapid that it becomes a foremost issue of concern. However, top management must put extra concern on technology challenge for a better decision making. Besides, they have to ensure various measures in terms of their management skills and organizational readiness. The most important thing is every government agency need to have proper ICT strategic plan to ensure the aim is persistent on track. In short, strategic plan will be the main guideline.
for every organization in terms of way of ICT thinking, particularly with relations to information and knowledge.

4. Conclusion

This case study has discussed several key indicators in public ICT strategy plan that have undergone several changes which mostly to align ultimate public ICT objective. This change was deemed necessary in order to revised all the strategic plan of ICT and even ICT delivery for the sake of guaranteeing the quality of information and data that have been shared and utilized at the same time giving access to the public.

As we are in digital era, all the system that functioning to provide access to user ought to be enhance thoroughly. In addition, all of these changes must lies on the professional, where usually CIO will be hold the main responsibility. A successful CIO that develops and agile, forward thinking IT function, mastering the basics and focusing on customer inspired-innovation, is bench marked to be an influencer for the entire organization. The top management might as well to give cooperation to ensure the mission and vision that has been aimed should be accomplished. Consequently, the new birth of Information Management division will be fully established as one of the government conquest to preserve and protect the valuable assets in ICT or IT as well as the information in safe hands.

<tbody>
<tr>
<td>Task and Responsibility</td>
<td>Clearly understand of CEO’s vision for IT</td>
<td>Develop well a good strategy of knowledge wisely</td>
<td>Shift digital capabilities into strategic priorities</td>
</tr>
<tr>
<td></td>
<td>CEO of the organization needs to share their full vision for organization hence the CIO will have the whole picture of the strategic plan of organization.</td>
<td>Leads executive management to develop an enterprise knowledge strategy; validates this strategy across the enterprise, and ensures that its evolution complements and integrates with business strategy.</td>
<td>Digital won’t get the visibility or support its requirements if it is not helping the company get where it wants to go. Develop and administer the digital project portfolio.</td>
</tr>
<tr>
<td>Roles in Organization</td>
<td>Recognize the ambiguity of CIO role</td>
<td>Develop tactical plants in Knowledge Strategy</td>
<td>Utilize the digital applications to measure successfulness</td>
</tr>
<tr>
<td></td>
<td>The CEO of organization need to identify of the CIO role thus the CIO can perform outstanding task and contribute endlessly to the in organization.</td>
<td>Oversees the development of tactical plans to implement the knowledge strategy, including which organizational units are implemented and when, and the definition of specific programs for harvesting, leveraging and creating knowledge.</td>
<td>Measure new efficiencies and Return on Investment (ROI). Shifting manual processes with technology drives lead to cost savings and revenue generation. The CDO’s oversight across digital initiatives positions him or her uniquely well to measure success.</td>
</tr>
<tr>
<td>Delivery of Services</td>
<td>Provide service and solution commitments</td>
<td>Strategy in managing top priority of daily tasks. Sets priorities and secures funding for knowledge management (KM) programs.</td>
<td>Analyse the multi-function of digital capabilities</td>
</tr>
<tr>
<td></td>
<td>CIO is expected to deliver effective IT services as well as able to lead the successful implementation of IT projects.</td>
<td></td>
<td>Provide as executive sponsor for digital process innovation. Other executives might not be measured on new functionality or economies of scale that digital capabilities enable.</td>
</tr>
<tr>
<td>Build a relationship</td>
<td>Form a strategy relationship</td>
<td>Form a relationship between KM program with the organizational structure</td>
<td>Multifunction of skills and capabilities</td>
</tr>
<tr>
<td></td>
<td>CIO ought to focus an attention on top management in order to fulfil their basic services. CIO need to fulfil most of CEO expectation regarding of IT’s environment at the same time proactively seek relevant information.</td>
<td>Oversees the building of the KM program and the implementation of the enabling infrastructure including designing and implementing an organizational structure, defining operating processes; specifying, selecting and implementing technologies and applications; and defining policies for security, usage, maintenance by knowledge owners and participation by user communities.</td>
<td>Become as “executive intermediary” during delivery. This often means enlisting involvement from other executives, re-establishing priorities, acting as a good tutor, or serving as decision during the rollout of digital capabilities.</td>
</tr>
