Abstract

In most cities of developing countries, old buildings always tend to undergo redevelopment. There are one or more than one reasons for this. Such as buildings which are in dilapidated condition or uneconomic to repair or tenants are in a need of more usable floor area. This activity of building redevelopment is much visible in Mumbai city for past decade and half. Because of various constraints and considerations, this process of projects of building redevelopment is quite complex. It takes considerable efforts and time to accomplish the projects. If a proper and time bound process is not followed, or if the risks, uncertainties and challenges are not handled properly, even a seemingly simple project can fail, thereby causing great anguish and hardship to the stakeholders. Sometimes this may lead to prolonged litigation.

There is a need to identify risks and challenges involved in the process of building redevelopment projects. The aim of researchers is to interact with all the stakeholders of building development projects of housing societies and identify various risks and challenges visa-a-vis gains. The study has also revealed various pitfalls and uncertainties related to these projects. This will enable concerned stakeholders to prepare to address these.

Keywords: Challenges; Housing Societies; Redevelopment; Risks.

1. Introduction

It is certain that urban areas transform themselves over time. Old buildings required to be redeveloped once they surpass their useful life. Nelson A (2014) [1] has while giving illustration about working out optimal time of redevelopment, explains that over a period, there is appreciation in land and depreciation in the structure of building. It is much more appropriate to redevelop building once value of land surpasses value of building. The situation in most of the buildings in Mumbai city is similar to this theory. Old buildings having a life of 20 to 40 years, while value of land with prevailing development control rules is much more than present value of their building and their usefulness. In Mumbai city, many buildings are subjected to the process of redevelopment irrespective of their age or life span. For this, reasons are many such as fear of collapse due to dilapidated condition of buildings, uneconomic to repair or need of more area or amenities or funds or combination of more than one of reasons. Due to quite a few gains supplemented by unavoidable circumstances, members go for redevelopment of their buildings in spite of risks and challenges involved.

Building redevelopment activity is quite complex due to various factors, dimensions and multiple stake holders. It is a multifaceted activity. It is imperative to understand risks and challenges beforehand.

2. Study area and relevance

This research study is focused on finding the risks and challenges of the process of building redevelopment projects in Mumbai city. This city is commercial capital of India, located at latitude 19.0760°N, departure 72.8777°E. The total area of three administrative parts (city proper, western and eastern suburbs) is 45628.49 Hectares.

Questionnaire survey carried out to capture global scenario with respect to redevelopment activity for few cities across the globe, reveals that redevelopment of buildings activity is not only very active in Mumbai city (90% proposals in building proposal department are of redevelopment), but also has unique pattern for process of delivery. This reflects relevance of study.

The building redevelopment projects in Mumbai city are classified into the following types:

b) Buildings due for redevelopment on collector’s land: These are dependent on government policies.
c) Individual Housing Societies: Weak and dilapidated buildings more than 30 years old. Tenants of these co-op societies need to take initiative themselves to move for redevelopment at their risk, cost and time.

This research work is carried out for the third type of projects i.e. building redevelopment projects of individual housing societies.

3. Methods

The present study is carried out in the four stages:-

1) Pilot Questionnaire survey.
2) Study of risks, pitfalls, challenges and uncertainties.
3) Interaction with all the stake holders.
4) Assimilation and analysis.

3.1. Pilot questionnaire survey
The small sample of tenants was identified from housing societies under redevelopment. Simple questionnaire was designed to undertake this. The factors identified were incorporated in pilot questionnaire survey.

The attributes identified were presented to respondents. The respondents (tenants, ten in number) were requested to respond to this. The rating of one most important attribute i.e. “Level of Risk” were sought on 1 to 10 scales, “1” represented “Strong disagreement” and “10” represented “Strong agreement". (See Table 1).

The outcome of analysis of Pilot Questionnaire can be summarized as follows:

1) The learned and updated lot among tenants feels relatively less risk in the process. [2].

2) Risk varies from project to project, person to person, phase to phase.

3.2. Study of risks pitfalls uncertainties and challenges

Risk is an abstract term. In a given situation, risk is viewed differently by different people. Risk in general signifies an uncertain event, situation, or condition which may occur. It may have either a positive or negative effect on the project objectives. Some risks may pose a threat to the achievement of objectives, whereas unfavorable risks are termed as threats.

Building redevelopment project is one type of turnkey reconstruction contract. Risk checklist of such project is given below. This list is indicative but not limited to the following: [4].

1) Project scope.
2) Design and Specifications risks.
3) Quality Risks.
4) Time overrun risks.
5) Cost overrun risks.
6) Leadership risks.
7) Organizational risks.
8) Physical resources, mobilization and utilization risks.
9) Technology risk.
10) Contractual risk.
11) Force Majeure and ecological risks.
12) Political, WTO, Legal and social risks.

Pitfalls are nothing but hidden risks. Building redevelopment projects may prolong over four to five years or more. During this gestation period, projects are prone to various kinds of uncertainties. Challenges are peculiar problems encountered during the process of projects. The solution to these challenges needs to be arrived at.

3.3. Interaction with the stakeholders

After having studied risks, pitfalls, challenges and uncertainties, interaction was carried out with all the stake holders of all the projects at different stages of redevelopment (all the four: those on anvil, under progress and complete and also including ones those are on hold) of housing societies. These stake holders include tenants, builders/developers, experts (Architects, Project Management Consultants, and Advocates) and officials from regulatory authorities such as MCGM, MHADA etc. This interaction was undertaken through interviews (with prior appointments) and structured questionnaires. Total 34 interviews of stakeholders were conducted comprising developers, experts and secretaries representing housing societies. The pre-designed questionnaires were put to these stake holders. The inputs received are very vital, important and are of high relevance. From these risks and challenges to the projects were identified.

3.4. Assimilation and analysis

The questionnaires were put to 215 stake holders (Tenants, Developers and Experts) of housing societies projects under various stages of redevelopment. Total 116 valid responses were received. The assimilation of inputs from interview and analysis of data from questionnaire was carried out. The same is classified into the following compartments.

- Preliminary findings.
- Pitfalls in process.
- Risks and challenges.

3.4.1. Preliminary findings

The Mumbai city has unique geography and geometry. It is more long than wide. It is surrounded by sea on three sides. City is commercial capital of India. Land is very scarce commodity here. Demand for housing always persists. This leads to high housing price index. Tenants and developers are two active partners and stake holders in venturing into process of building redevelopment of housing societies. Tenants opt for this option as it leads to the following gains.

1) New flat with additional area. Expanding growing family needs are met in same location.
2) New building with earthquake resistant, modern design, good look, lift facility and other amenities like parking garden swimming pool and club house etc.
3) Monetary benefits in terms of corpus fund to cover up future increases in taxes and maintenance charges.
4) Wealth creation. The housing unit when fully redeveloped has potential value of 2.5 times the present value of old unit.

The developers by virtue of additional FSI available as per prevailing norms constructs additional housing units termed as sale flats which not only generate funds for reconstruction but also decent mark up for them.

In view of above gains, both tenants and developers are tempted to go for redevelopment and many times ignoring risks and challenges...
involved. This paper attempts to identify, risks, pitfalls and challenges.

3.4.2. Pitfalls, risks and challenges

Further assimilation of inputs gathered from interviews and analysis of response received from pre-designed questionnaire, the outcome was consolidated into pitfalls, risks, challenges and uncertainties involved in the process of building redevelopment projects of housing societies in Mumbai city. The discussion follows subsequently.

4. Outcome

Outcome of this research work is as below
1) Probable pitfalls.
2) Risks and Challenges.
3) Uncertainties.

4.1. Probable pitfalls

Building redevelopment projects in Mumbai City is highly risk taking venture for both the parties’ i.e. the Tenants/members of housing society and also for the developer. Following are the probable pitfalls for which the members/tenants need to be careful.

- Organization and resourcefulness of the developer. If there is more than one partners/director, then in future there always remains possibility of split of business among them due to separation. Projects get divided among into future sub companies. Project allocated to less resourceful partner’s company is prone to risk of delay and even non completion. This risk can be mitigated to sufficient extent by proper water tight development agreement at initial stage.
- Boundaries and area of plot on which old building stands, neither match w.r.t. city survey maps nor town planning maps. Remarks by respective authorities may not be clear or even pending. It takes quite some time and huge efforts to sort out such types of mess. Hence to avoid falling into this pit fall, it is imperative to get total survey carried out during feasibility stage of the project.

Following are the probable pitfalls for which developer need to be careful before venturing ahead in building redevelopment projects of housing societies.

- Development Control regulations and likely changes expected in near future.
- Conflicting attitudes among members/tenants of housing societies.
- Records and remarks pertaining to the land and building on the piece of land whose redevelopment is to be undertaken.

Following are the major pitfalls as summarized below:

- Unclear/ Title, Restrictive policies, stays

<table>
<thead>

</tr>
</tbody>
</table>

4.2. Risks and challenges

Process of building redevelopment is complex and challenging. This is further complex in case of projects of housing societies. There are multi-stakeholders with varied knowledge, wisdom, expertise and socio-economic status. Dilapidated condition of buildings, Changing development control rules by regulatory authorities, market conditions contribute major risks, while physical condition of plot, coherency among tenants, making them vacant to alternate accommodation, mobilizing finance are major challenges.

If proper detailed feasibility study carried out at beginning, risks and challenges can be foreseen. Through proper discussion, transparency and communication same can be addressed during initiation phase itself. (See Table III and IV).
### Table 4: Challenges to Various Parties in Building Redevelopment

<table>
<thead>
<tr>
<th>A</th>
<th>Challenges to both parties</th>
<th>Key Factor</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Dilapidated condition of building or building in irreparable condition.</td>
<td>Structural audit and acting on its recommendation of its report.</td>
<td>MCGM guidelines to be followed for classification of buildings.</td>
</tr>
<tr>
<td>2</td>
<td>Sustaining coherency among tenants</td>
<td>Ensuring transparency and communication.</td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>Challenges to Tenants</td>
<td>Key Factor</td>
<td>Remark</td>
</tr>
<tr>
<td>1</td>
<td>Project becomes non feasible due to one or other reason after selecting and appointing developer.</td>
<td>Getting detailed feasibility before or revisiting development agreement if such situation arises.</td>
<td>Feasibility need to be dynamic.</td>
</tr>
<tr>
<td>2</td>
<td>Developer less resourceful with respect to finance.</td>
<td>Due diligence or bringing other developer with proper settlement of previous developer.</td>
<td></td>
</tr>
<tr>
<td>C</td>
<td>Challenges to Developer</td>
<td>Key Factor</td>
<td>Remark</td>
</tr>
<tr>
<td>1</td>
<td>Sudden shortage or unavailability of any construction material.</td>
<td>Adopt alternate material with consultation of Expert.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Challenging local site conditions like low water table or surrounding buildings requiring silence like hospitals or educational institutes.</td>
<td>Pre-bid survey necessary or resolving such challenges with mutual discussions and meetings.</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>No conveyance, Earlier failure, Height restriction, Highway /Railway, MOEF, CRZ, Group Redevelopment and Self Redevelopment.</td>
<td></td>
<td>These are specific challenges they may be there or not, varies from project to project.</td>
</tr>
</tbody>
</table>

Source: Conceptualized by author)

Notes: Terms Used:

- CRZ= Coastal Regulation Zone
- DA = Development Agreement
- DP= Development Plan
- DCR = Development Control Regulations
- FSI = Floor Space Index
- MCGM = Municipal Corporation of Greater Mumbai
- MHADA = Maharashtra Housing Area Development Authority.
- MOEF = Ministry of Environment and Forest

### 4.3. Uncertainties

Building redevelopment projects are hot-bed for various uncertainties and every possible dispute. Few are listed below.

- Market conditions: Though location of building redevelopment projects govern price of sale flats, however general mood in real estate market does have impact on project.
- Delay in implementation of DP and DCR.
- Defective Title of plot
- Non Co-operative members
- Non performing Developer
- Changing Regulations and Policies.
- Other policies: Inclusive housing, Buffers, NOCs, Civil aviation, Approvals costs, Court orders, stays etc.
