Abstract

Envisioning new innovation strategy, it is wisely to fostering the technopreneurship area of education in public higher education. To be an entrepreneurial universities, it initiate to have a focus on undergraduate student starting from enrollment to graduation, which offered constant encouragement, training and support for their efforts to conceive and start up business enterprises with prototype they conceive. In this regards, this paper examines a factors required by the universities in bolstering the better prelude efforts towards the students in technopreneurship by indicating the competition, technology transfer and university policy. Sample of study was taken from undergraduates students at public university involving 146 students which already been taught the technopreneurship course at university. The descriptive statistics, multiple regression analysis and t-test were used to investigate the effect factors. In line with previous studies, the results reveal that competition, technology transfer and university policy statically significant in influencing the technopreneurship education at university. Surprisingly, the study shows that competition plays a crucial part in enhancing a better outlook in this innovation. The exposure from competition will drive them to be a creative person in nature and laterally develop an entrepreneurship skill in future. The result is useful for policy makers as well as university in considering the effect of these 3 factors in the eyes of undergraduates. Exploratory in nature, globalization and surge demand on technopreneurship thus evolve the trend in vibrant economic growth, industrialize and development context.

Keywords: Technopreneurship Education, Technology Transfer, Competition, University Policy

1. Introduction

“Serving a clearly heterogeneous population with seemingly homogenous interventions appears faulty and this reality needs to inform pro-entrepreneurship initiatives in future”. [1]

Considering to broad literature, innovation and creativity via technopreneurship are the powerful drivers towards modern growth survival. Technopreneurship education provides much ongoing interpretation and responsiveness among universities since it’s provides significant values of adventurous youth burning with energy, passion, creativity and intelligence. The creativity and innovation plays a crucial part in education process as it will precast the end result of developing the nations. Many universities have looked toward entrepreneurship technologies to assist them in making transition and obtain the flexibility necessary to educate well the undergraduates into the future [2] [3] [4]. Selladurai (2016) stress that Malaysia, Singapore, Korea, India, China particularly aims to exports more the industrial product based on technology by drawing policies match in encouraging start-ups, productivity, regulations, capital venture as well as promotion on education of technopreneurship.

Many public universities aiming for entrepreneurship education and research by evolving the transformation from traditional university to more prudent and theoretically feasibility technological ideas and knowledge in generating properous venture. Initially theory on this relatively new phenomenon - technopreneurship, together with existing findings on technology transfer, competitions and university policy will be organized according to these three areas of technopreneurship research [5]. A unique theories conviction from [6] argues that a general positive attitude toward change orientation of entrepreneurship education. The weightage sought to entrepreneurship require more attention specifically public and private tertiary learning by implying more orientation based programme in order to produce well trained and ideas exploration graduates internationally [2] [7]. Understanding the level of succession of entrepreneurship intention among university students is particularly critical where the scourge of unemployment is profound [1]. Simply speaking, as a tool to override the hard times such as financial crisis, many observers believed this is the key implementation. Alive to this, government and higher education providers are investing in technopreneurship development, the gain of which remains to an ebbing of hope in the youth population.

Therefore, this study was conducted in order to explore the significant relationship via literatures upon 3 consequences technology transfer, competition and university policy to enhance creativity and innovation in technopreneurship education.
2. Historical Context of Technopreneurship Education

An abundance theory emerged concerning technopreneurship in the context of education laterally start from case study made by [6] where the importance of consumer belief will result the attributions of repeating purchases, Shapero & Sokol, (1982) come out with the independently model of [8] with the extinction of entrepreneurial event model (EEM) highlighting the foundation of feasibility, desirability and propensity to act towards entrepreneurship intention. Katz (2003) comeout with the chronology advancement between the entrepreneur education and perceived to believe that the importance of added items in technology via enterprise education pursuing a better engagement. Similar to this, more more research has very much revolved in the area of determinants, processes, outcome of technopreneurship education. Again,a review literature concerning determinants of technology transfer, competitions and university policy yet to be perceived [9] [10] [11].

3. Technology Transfer

Transfer of knowledge become due as it always is carried out to achieve the transfer objective. It believed to bring a major change in future result as long as person in charge to be tactical and supportive in bring down the knowledge skills. Apart from university based education plan competitions, there are private sector competitions sometimes driven by venture capitalists to garner interesting projects and also to screen prospective recruits for their funds. The interactions among major stakeholders involved in knowledge creation and capitalization, universities, industries, government brings the optimization of commercialization of knowledge [12]. Andrzej (2005) recognized knowledge and innovation as crucial factors from the top management. He argues that the technology transfer may transit the best value in it if all the academicians, policy makers, companies play their part effectively. It’s a basic technical innovation that carries an after effect values in the forms of creativity and innovation dispersion. Amabile (2013) describes creativity as the ability to come with new ideas while Johnson (2001) considers technology captures any useful innovations. Following the preceding definitions, technology transfer can thus be defined as the ability to come with new ideas whose consequence is the development of useful innovations. Thus, technology transfer serves a functional purpose [13] that manifests through the idea-driven, business value generation from the exploitation of creative inventions or innovations in pursuit of solving business or societal problems. Pei, Noordin, Ting, & Baharudin (2010) also focusing towards the failure factors of techopreneurship education and believed that technology impactful on internal and external basic of young techopreneur in gaining a branding product starts from the stages of education and it leads them to excell in the future.

4. Competitions

The best way in which entrepreneurship been encouraged is by business plan competition [12] and many more public and private universities had organised competition by giving out awards recognition. External factors associated with learning process technopreneurship within classes then being carried out in the form of competition- business entrepreneur ship [14]. Malaysia specifically compressed the competition into 2 section namely academic and non-academic in order to nurture as well as promoting national technopreneurship initiatives [15]. The potential outcome resulting from this competition will then providing a new hybrid tool and a good signal towards potential seekers inventors. The teams receive air time with potential financiers, investors and mentors. However, the longer returns of this competition are yet to be discovered and need to observe. Oukil (2007) believed that the corporate structure via competition as in national innovation agenda will then create solving practical problems such as increasing productivity and encourage innovativeness, exploitation of new ideas and use of talents and competences. Entrepreneurship development will also help ideation and initiative to emerge and free economies from the drawbacks and constraints of the public sectors. Besides innovation and entrepreneur development, recourse to knowledge will, of course, fasten the development process and up-grade capabilities in favor of a real and durable development. [16] [7] [2].

5. University Policy

The best solution in making one top edge technopreneurship education said that the participation and continuous commitment made by university itself. [17] Believed to be in order to transform Singapore’s from investment driven economy into innovation driven economy, policy makers charted the needed of intellectual capital and its commercialization by creating value down from the university courses. The mode of entrepreneurial university mission and governance at a consequent level will then improve the rhythms of University in catering the needed of knowledge based economic growth [18] [19]. Sohn & Kenney, 2007 argues that strong university-industry linkages are the key in fostering the techopreneurship as well as the strong commitment made by the government. The important contribution of universities to economic development is by focusing on entrepreneurial focus on graduates. The famous metaphor quoted that university research was the magic seed that may grows the economic. This recognition perceived that the equally important roles play by the universities to realise all the planned setup by the government [16]. Okorie, D.Y.Kwa, Olusunle, A.O.Akinyanni, & Momoh (2014) believed that in order to make it achievable, technopreneurship entails tertiary and professional development courses as well as strategic planning who will sharpen business skills and market savvy. To nurture the innovative culture at university, the technical session, workshops, conferences, seminar, training on the special fields need to handle.

In becoming Entrepreneurship University, modern teaching and training that match with the demand criterion as well as up to date syllabus curricular synonym at international standard being much concern. New entrepreneurs need to be educated and trained, particularly when it comes to exploitation of technologies and innovations [20] [3]. Selladurai, (2016) believed that many countries including Malaysia, the technopreneurship education still lacking and deserve an attention from government to be specific. Before, technopreneurship is not perceived as a formal educational outcome. The role of governments in supporting entrepreneurship development has to be firm so that the university policy can be conform. Morrison (2006) for example, cited a number of Arab countries whose governments have tried to promote entrepreneur ship and succeeded to some extent. Arab countries have, in general, invested a lot in the information and communication technology (ICT) sector. This has helped organizations in the region to modernize their operations and up-grade their performance. Technological innovation-based entrepreneurship or ‘technopreneurship’ is very attractive because of its expected high impact compared to ordinary trade or service-based business. It is believed from the recent empirical studies show that the more innovative a start-up activity, the more its impact on growth [20].
6. Data Methodology and Findings

This study worked on case study survey method to gather a number of data from the undergraduates’ students from Mara University of Technology Kelantan Branch in Malaysia. The gathered data were then being analyzed qualitatively and quantitatively using Statistical Package for the Social Science (SPSS) version 17 Regression analysis. Later, the results are explained in details by using frequency distribution and reliability test supported with Pearson Correlation Analysis, Multicollinearity and Multiple Regression Analysis to test the relationship between dependent variable and independent variables [21] [22]. The simple random sampling techniques were chosen as it encounters the requirements for this study [23] where 100% of them were undergraduates’ students from Mara University of Technology Kelantan Branch from batch 2016-2017. From the descriptive analysis 72% of them are female and 28% of them are male ages from 21 and 23.100% of them are from Bachelor Degree of Statistic part 5 and 6 in July 2017. In order to examine the result, we follow the methodology of recent literature, focusing on the enhancing factors of technopreneurship education to higher public universities [12] [24] using the descriptive analysis, correlation and multiple regression analysis. To reliability test, it shows Cronbach’s Alpha for Technopreneurship education (dependent variable) is 0.874. It indicates that the internal consistency is good and the questions developed are reliable. The Cronbach’s Alpha for technology transfer, competitions and university policy were 0.901, 0.857 and 0.783 respectively, thus the construct measures are deemed reliable and all items in the construct measures are retained. We assumed the function as:

\[ \text{ENT} = \alpha + \beta_1 \text{TT} + \beta_2 \text{CO} + \beta_3 \text{UP} + e \]  

(Equation 1)

Where:

- **ENT** - technopreneurship education
- **TT** - technology transfer
- **CO** - competition
- **UP** - university policy
- **e** - errors

Convert to the values:

\[ \text{ENT} = 0.181 + 0.244 \text{TT} + 0.394 \text{CO} + 0.111 \text{UP} + e \]  

(Equation 2)

The coefficient value for competition is the highest among other variables and it shows that this variable is the most factors that influence the succession of technopreneurship education in public university. Whereby the others 2 factors university policy and technology transfer indicate for 1% increase of these variables, technopreneurship education will increase by 0.2444 and 0.111 respectively.

a. Dependent Variable: Technopreneurship Education

In answering the objectives of the study, Table 2 above shows the value of R obtained is 71.9% and the R Square or coefficient of determination of 0.618. It means that only 61.8% of the variation in ENT is explained by changes in TT, CO and UP variables. The p-value for the F-test statistics is 0.000 which is less than 0.05 significance level. Therefore, it is significant and the null hypotheses are rejected. It means that at least one of the independent variables is useful in order to predict the dependent variable. The overall regression model is reliable since the research show significant value which is 0.00 or 100%. Meanwhile in considerable to coefficient t-statistic for all the variables, the T-statistic value for all variables are more than t-critical value, the decision is reject null hypothesis because there is a relationship between technology transfer, competitions and university policy with technopreneurship education in public university. It is tandem to the overall objectives supported by [4] [11] [16] [25] in laterally confessed to believed that these 3 variables play an important factor in revamping the succession technopreneurship model in higher public education.

7. Conclusion

To this end of the study executed from a positive standpoint surveyed 146 students in derived hythesis relationship. Finding believed that competitions plays an abundant factor in excelling the technopreneurship among undergraduates students [18] [19]. Even so, technology transfer and university policy also plays as much needed factors with aiming of sound model for revamping the technopreneurship education [10] [25] [3]. Forum (2009) had urged the innovation to the top of the development agenda by providing policy underpinning of technopreneurship education theory at the university. It is essential for policy makers, universities as well as researchers to recognize the technopreneurship pattern [12] [24]. It is necessities to develop a firm creativity and innovation process in technopreneurship aiming for new scientist and inventor who technologically capable, productivity driven and competitive at both the local and global markets. In order to be sustained and embrace the economy, the local market pursues young inventors in growth continuation [17] [18] [2]. The pedagogy mainstream of creativity and innovation must in line with the government objective in enable environment for this to thrive. Entrepreneurs are basically creative and innovative. Creativity and innovation are the distinguishing marks of the entrepreneur. Two dimension of creativity and innovation sparks an eye opener in different ways and recognise the resources available as to create their own prototype [26] [24] [5]. A tiny and a silly idea would work the best in vibe of technopreneurship and thus the commitment from all the angle agencies much more needed. The process to seeing something through to the end and not being satisfied until all is accomplished is a central motivation for entrepreneurs. Thus, believe it or not, the technopreneurship education requires greatest attention.

Serving a clearly heterogeneous population with seemingly homogenous interventions appears faulty and this reality needs to inform pro-entrepreneurship initiatives in future.
